Standard Specification for
Mineral Fiber Thermal Insulating Cement

This standard is issued under the fixed designation C 195; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers mineral fiber thermal insulating materials in the form of dry cement, which, when mixed with a suitable proportion of water, applied as a plastic mass, and dried in place, affords resistance to heat transmission on surfaces operating at temperatures between 100 and 1600°F (about 38 and 871°C).

1.2 The values stated in inch-pound units are to be regarded as the standard. The SI equivalents of inch-pound units are given in parentheses and may be approximate.

1.3 The following safety hazards caveat pertains only to the test methods section of this specification: This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2.1 ASTM Standards:
C 163 Practice for Mixing Thermal Insulating Cement Samples
C 166 Test Method for Covering Capacity and Volume Change Upon Drying of Thermal Insulating Cement
C 168 Terminology Relating to Thermal Insulating Materials
C 353 Test Method for Adhesion of Dried Thermal Insulating or Finishing Cement
C 354 Test Method for Compressive Strength of Thermal Insulating or Finishing Cement
C 356 Test Method for Linear Shrinkage of Preformed High-Temperature Thermal Insulation Subjected to Soaking Heat
C 390 Criteria for Sampling and Acceptance of Preformed Thermal Insulation Lots
C 405 Practice for Estimating Consistency of Wet-Mixed Thermal Insulating Cement
C 1045 Practice for Calculating Thermal Transmission Properties From Steady-State Heat Flux Measurements
C 1058 Practice for Selecting Temperatures for Evaluating and Reporting Thermal Properties of Thermal Insulation

3. Terminology

3.1 Definitions—Terminology C 168 shall be considered as applying to the terms used in this specification.

4. Materials and Manufacture

4.1 Mineral fiber thermal insulating cement shall be composed of mineral fiber, with a suitable proportion of heat-resistant binder.

4.2 The mineral fiber shall consist of rock, slag, or glass processed from a molten state into fibrous form.

4.3 Asbestos shall not be used as an ingredient or component part of the product.

5. Other Requirements

5.1 The cement shall conform to the requirements given in Table 1. Conformance shall be based on results of tests on specimens first mixed with water, according to the ratio for proper troweling consistency determined in accordance with Section 10.

6. Qualification Requirements

6.1 The following requirements are employed for purposes of initial material or product qualification:

6.1.1 Consistency,
6.1.2 Compressive strength,
6.1.3 Linear shrinkage,
6.1.4 Apparent thermal conductivity, and
6.1.5 Dry adhesion to steel.

7. Sampling

7.1 The cement shall be sampled, for the purpose of tests, using one of the following procedures. Unless otherwise specified or agreed upon between the purchaser and the manufacturer or supplier, the cement shall be sampled using...

*At the user is advised that some applications could require the knowledge of the thermal conductivity of the insulating cement at mean temperatures above those shown. Consult the manufacturer for data at mean temperatures exceeding those listed.

8. Number of Tests and Retests

8.1 If the average of the test data obtained using 7.1.2 fails to conform to the requirements of this specification, a second sample shall be taken from the lot. Average the results of the retest with the results of the original test to determine compliance with this specification.

7. Specimen Preparation

9.1 Mix specimens for testing in accordance with Practice C 163.

9.2 Water-Cement Ratio for Proper Troweling Consistency—For each lot of cement to be tested, determine the ratio by weight of water to be mixed with cement to obtain satisfactory troweling consistency. For tests to determine compliance with this specification, the water-cement ratio shall be that which gives the measured consistency of 20 to 30% by the Deformation Method when determined in accordance with Practice C 405.

10. Test Methods

10.1 Consistency—Practice C 405.

10.2 Dry Covering Capacity—Test Method C 166.

10.3 Volume Change Upon Drying—Test Method C 166.

10.4 Compressive Strength—Test Method C 354.

10.5 Linear Shrinkage—Test Method C 356.

10.6 Apparent Thermal Conductivity—Test Method C 177 or Test Method C 518. The apparent thermal conductivity versus mean temperature shall be calculated in accordance with Practice C 1045. Determinations shall be made at four or more mean temperatures. Select the test mean temperatures from the standard temperature conditions in Practice C 1058. Two of the test mean temperatures shall be within 25°F of the highest and lowest mean temperatures specified in Table 1. The other two determinations shall be made at mean temperatures equal spaced with the specified range. Prepare the test specimens as follows:

10.6.1 Mold test specimens in a mold of suitable size and shape for the equipment to be used and 1½ in. (38 mm) in depth. The cement shall be mixed with water in accordance with Practice C 163. Place the mold in a horizontal position on a piece of glass 14 in. (360 mm) or 15 in. (380 mm) square, or slightly larger than the specimen required. Place the mixed cement in the mold, trowel the top surface of the cement smooth, and place a sheet of ordinary writing paper on top of the cement. Place a ⅛-in. (3-mm) thick steel plate 14 in. (360 mm) or 15 in. (380 mm) square, or slightly larger than the specimen required, having nine equally spaced holes ⅛-in. (5 mm) in diameter in the central area 10 in. (250 mm) in diameter, on top of the mold and use a pointed pin to puncture the paper immediately under the holes in the steel plate. Invert this entire assembly and remove the glass plate, trowel the surface of the cement smooth and flush with the top of the mold, and then carefully remove the mold. Place the perforated plate with the molded cement on an open shelf of an oven having a volume at least 50 times that of the specimens to be dried. The oven chamber shall be adequately ventilated in such a manner as to ensure complete circulation of the atmosphere of the entire oven chamber preferably by fan or other forced circulation method. The test specimens shall remain in the oven for at least 48 h at a temperature of 215°F (102°C) to 250°F (121°C). Upon removal from the oven, the surfaces of the specimens shall be made plane and parallel by cutting, sandpapering, or rubbing, or by a combination of these methods. The lateral dimensions of the specimens shall be governed by the size of the apparatus.

10.6.2 Temperature of test shall be in accordance with Practice C 1058.

10.7 Dry Adhesion to Steel—Test Method C 353.

11. Inspection

11.1 The following requirements are employed for purposes of acceptance sampling of lots or shipments of qualified cement:

11.1.1 Dry covering capacity.

11.1.2 Volume change upon drying.

12. Rejection and Rehearing

12.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the manufacturer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the manufacturer or supplier may make claim for a rehearing.

12.2 In case of rejection, the manufacturer or supplier shall have the right to inspect and resubmit the lot after removal of that portion not conforming to the specified requirements.

13. Certification

13.1 When specified in the purchase order or contract, the
purchaser shall be furnished certification that samples representing each lot have been either tested or inspected as directed in this specification and the requirements have been met. When specified in the purchase order or contract, a report of the test results shall be furnished.

14. Packaging

14.1 Unless otherwise specified or agreed upon by the purchaser and the manufacturer or supplier, the cement shall be packaged in the manufacturer’s standard commercial containers.
